The protein and the nucleic acid that encodes it, are used to identify compounds, including herbicides and plant-growth regulators, that alter activity or expression of the protein. The nucleic acid is also used to produce transgenic plants with altered activity or expression of the protein and for recombinant preparation of the protein. The invention relates especially to the fiddlehead (fdh) protein (GenBank Accession Number CAA09311) and encoding DNA sequence (GenBank Accession Number AJ010713) isolated from the thale cress Arabidopsis thallana and with VLCFAE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 200

                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes the isolation of beta-keto acyl synthase proteins from Arabidopsis thaliana. The products of the invention can be used for producing vegetable oils having elevated levels of very long chain fatty acids (VLCFA) for use as e.g. lubricants, fuels and as a feedstock for plastics, pharmaceuticals and cosmetics. The products can also be used for producing oils having reduced levels of VLCFAs for use as edible oils. This sequence encodes EL4.

AAQ90210;

04-DEC-1995 (first entry)

Brassica condensing enzyme clone, CE15, from LEAR variety

Brassica; condensing enzyme; CE15; SS

Brassica, LEAR variety 212

Location/Qualifiers 4..1650 /\*tag= a

Two primers were synthesised - Q90226 and Q90227. Q90226 corresp. to the peptide NITTIG, which is AAS COTESP. To the peptide SNCKFG, which is AAS 525-532 of the Jojoba beta-ketoacyl-CoA synthase, and Q90227 COTESP. To the peptide SNCKFG, which is AAS 525-532 of the COTESP. To the peptide SNCKFG, which is AAS 525-532 of the COTESP. To the peptide SNCKFG, which is AAS 525-532 of the COTESP. To the peptide SNCKFG, which is AAS 525-532 of the COTESP. To the peptide SNCKFG, which is AAS 525-532 of the COTESP. To the peptide SNCKFG, which is AAS 525-532 of the COTESP. To the peptide SNCKFG, which is AAS 525-532 of the primers and antisense strands of the respective peptides. The primers COTESP. To the QUARTIESP. To the primers and LEAR RNA were subjected to RTPCR. Prominent bands of the Example of COTESP. The PROMETICAL COTESP. The SNCKFG, which appear to from two classes of cDNA clones, designated CEIS COTESP. The 212/86 CEIS clone encoded the entire CE protein CE and CE20. The 212/86 CEIS is expressed at high levels in leaves and at CEIS and CE20 are almost identical. CE20 is highly expressed in Cerusian and expressed in the servences of a the protein sequences of CEIS and CE20 are almost identical. CE20 is highly expressed in Cerusian and expressed and at every low levels in leaves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Rameaka uc
Parcia CA,
Parcia P;
The invention relates to an Arabidopsis thaliana nucleic acid (I) comprising a sequence capable of hybridising under stringent conditions to a sequence scleeted from any one of 999 sequences (ABN98231-ABN99231), given in the specification or its fragment. A polypeptide (II) encoded by (I), a transgenic plant (III) comprising an exogenous nucleic acid, is useful for screening a candidate agent for its biological effect. (I) is useful in identifying homologous or related genes, in producing compositions that modulate the expression or function of its encoded protein, mapping functional regions of the protein and in studying associated physiological pathways. (I) is also useful in salso useful in
                                                                                                                                                                                                                                                                                                       Claim 1;
                                                                                                                                                                                                                                                                                                                                          New Arabidopsis thaliana nucleic acid for identifying homologous producing compositions that modulate the expression or function encoded protein, and mapping functional regions of protein -

for enhancing or inhibiting production of a biosynthetic product in a plant. (III) is useful for identifying other mediators that may induce expression of proteins of interest, for establishing the extent to which any specific insect and/or pathogen is responsible for damage to a particular plant, for identifying other mediators that enhance or induce tolerance to environmental stress, for identifying factors involved in biosynthetic pathways of nutritional, commercial, or medicinal value and for identifying productions of nutritional, commercial or medicinal value and for alteration of the cellular metabolism and for screening compounds that may affect the biological function of the gene or gene products. Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence.html?DocID-999909770445. screening assays of various plant strains to determine the strains that are best capable of withstanding a particular disease or environmental stress. (II) and (III) are useful for screening of biologically active agents, e.g. fungicides, insecticides, etc., for elucidating biochemical pathways. The screened agents are useful in improved methods of treating crops to prevent or treat disease. (II) are also useful in screening programs to identify agents that mimic or enhance the action of tolera factors. Such agents are useful in improved methods of treating crops enhance their tolerance to environmental stress. (I) is also useful tolerance ç

2 Wax-synthases were isolated from a jojoba microsomal membrane prand tryptic fragments were sequenced (AAR79935-42). The sequence information was used to design oligonuclectide probes for screening jojoba embryo cDNA libraries. A 1.5 kb clone was isolated and additional sequences were identified by 5'RACE or by rescreening. Clone pcGN7614 was obtd. (AAT04124) that encoded wax-synthase, and was used to construct plasmids for transformation of plants.
   DNA construct expressing jojoba wax synthase and transformed Brassica cells - useful for producing wax ester(s) for use in pharmaceuticals and cosmetics, etc

RNA is isolated from jojoba embryos and used to construct a cDNA library. Synthetic oligos are synthesised which corresp. to the AA sequences of selected peptide fragments and segments of DNA are produced. The DNA fragments obtd. by PCR are labeled and used as a probe to screen clones from the cDNA libraries. An approx. 1500 nt. jojoba cDNA clone is obtd. in this manner. Comparison to the peptide fragments in AAR77175-R77182 reveals the presence of the presence of the control of the peptide fragments in AAR77175-R77182 reveals the presence of the control of the peptide fragments are sentenced.

  each of these peptides in the translated sequence, with the exception of SQ1129. The mRNA is approx. 2kb. Preliminary DNA sequence of a jojoba gene is presented in AAQ90107/R77164. Further DNA sequence analysis of additional clones indicates that there are at least 2 classes of cDNAs encoding this jojoba protein. The plasmid contg, the entire coding region in pCNN1703 is constructed to contain a SalI site approx. 8 nts 5′ to the ATG start codon and is designated pCGN7614. The complete DNA sequence of pCGN7614 is given in AAQ90208/R77165. The major difference between the two classes of cDNAs is the presence (AAQ90207) or absence (AAQ90208) the 6 nt coding sequence for AAS 23 and 24 of AAR77164.

seeds of Lunaria annua, Tropacelu majus (Nasturtium), and green illiques of Arabidopsis thaliana. The primers most successfully utilised were AAQ090221 and AAQ090222. These primers wer used to produce three clones encoding a portion of the elongase condensing enzyme from Arabidopsis. From Lunaria a single clone was identified, LUN CEB. A cDNA library from RNA isolated from developing seeds of Lunaria was constructed, and LUN CEB was used to screen this library. Three classes of cDNA clones were isolated, Lunaria 1, Lunaria 5 and Lunaria 27. Lunaria 5 shares approx. 85% homology with the Brassica CE20 clones, and it is suggested that it is active in seed oik fatty acid elongation.
  The CE15 and CE20 Brassica cDNA sequences (see AAQ90210,Q90211 and AAQ90211) and the condensing enzyme encoding sequence from jojoba (AAQ90208) were used in determining primers AAQ9021-AAQ90225 from conserved AAs. These primers were variously used PCR (RTPCR) amplify fragments from RNA isolated from developing
  Production of very long chain fatty acid(s) in plant(s) - to produce drought and stress resistant transgenic plant(s)

  This invention describes the isolation of beta-keto acyl synthase proteins from Arabidopsis thaliana. The products of the invention can be used for producing vegetable oils having elevated levels of very long chain fatty acids (VLCFA) for use as e.g. lubricants, fuels and as a feedstock for plastics, pharmaceuticals and cosmetics. The products can also be used for producing oils having reduced levels of VLCFAs for use as edible oils. This sequence encodes EL7.

   The present invention relates to a plant long chain fatty acid condensing enzyme, KCS2 (beta-ketoacyl-coenzyme a synthase 2). The invention is useful in cosuppression or antisense inhibition, as a plant breeding tool, as molecular markers to aid in plant breeding programs and in screening
  1342
   1380 ATTTCAGCGAAACTTCTCTTGAGTTCCAGAGGAAGATCTTGATTCGCTCTGGTCTCGGTG
   Novel nucleic acid sequence encoding plant long chain fatty acid (LCFA) condensing enzyme (fatty acid elongase) useful for producing transgenic plants having altered fatty acid content in the tissues
  Long chain fatty acid condensing enzyme; KCS2; beta-ketoacyl-coenzyme A synthase 2; cosuppres screening; ds.

Maximum DB
   Total number of hits satisfying chosen parameters:
   Scoring table:
   Perfect score:
  OM nucleic - nucleic search, using sw model
   Result
  Post-processing:
  Sequence:
  ð
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
